

## Flood Information Management – Problem Identification Interview and validation

**Purpose:** *This interview aims to understand the current workflows, processes, and systems used by the organization in flood monitoring and disaster response. The information gathered will help identify existing practices, challenges, and gaps in the collection, analysis, and dissemination of flood-related data. This understanding will serve as the basis for later analysis of how information systems might address these gaps*

1. Can you briefly describe your office's role in flood monitoring and disaster response in Bacoar City?
2. What flood-related data does your office currently collect (e.g., rainfall, flood levels, affected areas)?
3. In what format are these data stored? (e.g., Excel, GIS, paper records, databases or etc...)
4. Do you currently use any tools or systems for flood mapping or risk assessment? If yes, what tools or methods are used?
5. Are there specific barangays in Bacoar that are consistently flood-prone? What factors contribute to this?
6. How does your office communicate flood warnings or risk information to residents? (e.g., SMS, social media, barangay announcements)
7. Based on your experience, how effective are these methods?
8. What are the biggest challenges residents face in understanding or responding to flood warnings?
9. What limitations does your office face in collecting, analyzing, or sharing flood-related information?
10. From your perspective, what is the biggest gap in how flood information is delivered to residents?
11. **V1.** Our survey found that 92% of respondents experience flooding, 64% have made wrong decisions due to lack of flood information, and the top problems cited were late warnings and unclear risk information. Do these findings align with what your office observes on the ground?
12. **V2.** Based on the gaps identified in our survey, our research is exploring the possibility of developing a mobile-based tool that would help residents visually understand flood risk levels in their specific area in Bacoar City. Do you think there is a genuine need for something like this among residents and from your office's perspective?
13. **V3.** Would your office be open to collaborating with our research team during the development of this system — for example, by providing historical flood data, validating flood susceptibility classifications, or serving in an advisory capacity?
14. **V4.** If this system is developed and made available to Bacoar City residents, would your office consider endorsing or recommending it as a supplementary flood awareness tool?
